

# Gap Road Level Crossing

Level Crossing Removal, Gap Road, Sunbury

**ProGuard™** decorative coating were chosen over competitive systems, due to a number of considerations including; fast application, coating breathability, and surety of completion to timelines.

NANOKOTE was engaged to supply and install **ProGuard™** coatings to approximately 1,000 square metres of concrete infrastructure, being Bridge piers and crosshead, road barriers, retaining walls and panel walls.

The **ProGuard™** application program required development of a detailed works program, and selection of optimal application methodologies (brush, roll and spray) in order to satisfy the customers requirements, and comply with the challenging construction program.

NANOKOTE was able to maximise work on site time and minimise impacts to customers because using **ProGuard™** there was no

requirement for the applicators to return to the work area more than once, allowing:

- application work to be undertaken quickly
- minimal application interruptions
- standard access equipment to be employed
- flexibility of moving from one work area to another to suit operational needs
- substitute **ProGuard™** for other coating systems on other substrates.
